Investigation Engine — Live

Read-only · Evidence-backed

Product Overview · July 2026 · Confidential

What AccountIQ Is

AccountIQ connects to a company's accounting data — Tally exports, Zoho Books, or uploaded General Ledger and GST files — and **automatically investigates the books**. Instead of waiting for someone to ask the right question, it proactively surfaces GST risks, vendor issues, duplicate payments, unusual expenses, cash leaks and opportunities — each with the supporting evidence, the rupee impact, and a recommended action, before month-end.

The shift: AccountIQ is moving from an "AI query tool" (you must ask) to a **Financial Investigation Platform** (the system investigates and tells you what to fix first). The query engine becomes a drill-down capability — not the front door.

The Core Problem

Indian SME finance teams lose real money to things they only discover after the fact:

- **Blocked ITC** — a vendor doesn't file GSTR-1, so Input Tax Credit is reversed weeks later, with interest.
- **Duplicate payments** — the same invoice paid twice, caught (if ever) at year-end.
- **Cash stuck** in receivables nobody chased; **TDS gaps**; **expense spikes** nobody flagged.

Today this is done manually — exporting reports, rebuilding pivots, eyeballing ledgers. AccountIQ automates the investigation.

How It Works

1 · Upload — Import your Tally/ERP export. Document types (GL, GSTR-2B, GSTR-1, Form 26Q...) are auto-detected; columns auto-mapped.

2 · Investigate — The engine reviews the data against GST records and history, and produces a prioritised report of findings.

3 · Review & act — Each finding shows the evidence, ₹ impact and recommended action. Drill deeper by asking follow-up questions in plain English.

Every Finding Answers Five Questions

This is the trust model — no vague alerts, no black box. A finding isn't production-ready unless it answers all five:

#	Question	Field
1	What business question does this answer?	businessQuestion
2	What evidence proves it?	evidence (materialised rows)
3	How much money / risk is involved?	impactRs
4	What should the team do next?	recommendation
5	How can they verify it?	verificationSteps

Eight Architecture Principles (frozen)

- 1 Business Context is resolved before execution begins.
- 2 Investigations declare **capabilities** (e.g. GENERAL_LEDGER, INPUT_TAX_CREDIT), not connectors.
- 3 The Runner resolves dependencies — investigations never self-discover data.
- 4 Every investigation runs against an **immutable snapshot** (reproducible, no mid-run drift).
- 5 The LLM **explains** evidence — it never generates it. One AI-written field only.
- 6 Evidence is **materialised** at run time, so a finding survives the 90-day raw-data expiry.
- 7 Findings are **superseded, never deleted** — full history for trends and disputes.
- 8 Every finding declares its **resolution condition** (what makes it go away).

Privacy by Design

Sensitive fields — vendor and customer names, references and amounts — are **encrypted and masked before any analysis runs**, and are never exposed to any AI model. The platform is strictly **read-only**: it analyses your books, it never modifies them. Data is stored in AWS Mumbai (ap-south-1), isolated per organisation.

The Investigation Library

Investigation	What it answers	Status
GST Vendor ITC	Which vendors are putting my Input Tax Credit at risk?	LIVE
Vendor Risk	Which vendors need attention (filing trend, concentration)?	NEXT
Cash Health	Where is money moving; what's stuck in receivables?	NEXT
Duplicate Payment	Have we paid any invoice more than once?	PLANNED
Expense Analysis	Which expenses changed abnormally this month?	PLANNED
Profit / Margin	Why did profit or margin change?	PLANNED
Receivables / Working Capital	What's overdue; where can we free up cash?	PLANNED

Adding an investigation = one file, registered in the registry — the runner and UI need no changes. The framework is the moat.

Sample Investigation (what a report looks like)

A live, interactive sample runs at acctqai.com/sample-report on fictional data. It produces findings such as:

Finding	Severity	₹ Impact
3 vendors haven't filed GSTR-1 — ITC at risk	Critical	₹1,24,500
Duplicate payment to a steel vendor	Critical	₹68,000
Receivables stuck beyond 60 days	Attention	₹4,70,000
Marketing spend up 181% vs 3-month average	Attention	₹76,000
Unclaimed ITC available in GSTR-2B	Opportunity	₹25,000
TDS not deducted on professional fees	Attention	₹2,200

Supporting Capabilities

GL ↔ GSTR-2B reconciliation

Vendor ITC risk — the moat check.

GL ↔ GSTR-1 reconciliation

Outward-supply filing vs the books.

GL ↔ Form 26Q (TDS)

TDS deduction & deposit gaps.

Vendor ITC Scorecard

Per-vendor risk bands, persisted across months.

Daily Pulse

8 AM email — deadlines, TDS gaps, vendor filing risk.

Drill-down Query (plain English)

50+ templates → RAG → LLM. Now a follow-up tool.

Data Quality Scan & Flux

Bad-data detection; period-over-period variance.

Month-end Close engine

Checklist, owners, status — not a WhatsApp sheet.

Why Not Just Tally + Excel?

Without AccountIQ	With AccountIQ
Export reports, rebuild the same pivots monthly	Upload once — a prioritised report in minutes
Eyeball ledgers for anything unusual	Risks & anomalies surfaced automatically
Find the GST mismatch after ITC is reversed	Catch blocked ITC before it's reversed
Hope nobody paid an invoice twice	Duplicate payments flagged with both vouchers
Prep management summaries by hand	The executive summary is written for you

The ROI: hours of month-end investigation become minutes — and the risks that cost real money are caught before they hit working capital.

Pricing

Plan	Price	For
Starter	₹999/mo (₹9,990/yr)	One business or a CA with one entity
Growth	₹2,999/mo (₹29,990/yr)	Growing businesses & multi-client CAs
Enterprise	Custom	Large firms, multi-entity groups, CFO offices

Simple pricing — no usage limits, no AI credits, no hidden costs. 14-day free trial.

Tech Stack

Frontend

Next.js 14

Tailwind CSS

TypeScript

Backend & Data

- Prisma ORM
- PostgreSQL (AWS RDS Mumbai)
- pnpm monorepo
- pure investigation-engine pkg

AI & Privacy

- Groq Llama 3.3 70B
- Claude (fallback)
- PII tokeniser (mask in/out)

Infrastructure

- AWS EC2 + PM2
- nginx + Certbot SSL
- Razorpay billing

Current Status

Area	Status
Investigation engine + GST Vendor ITC investigation	Live (v1)
Investigation report UI, run/report APIs, persistence	Live
GSTR-2B / GSTR-1 / 26Q reconciliation + Vendor Scorecard	Live
Daily Pulse, Query engine, Close engine, Razorpay	Live
Repositioned marketing site + interactive sample report	Built
Investigations #2–3 (Vendor Risk, Cash Health)	Next
Tally / Zoho live connectors, live GSTN API pull	Roadmap
